Change Admin Password Prompt Explained

https://gemini.google.com/app/51250205fa96439f

User prompt: this is coming i am not able to change my admin password

Response: The prompt you are seeing is a **User Account Control (UAC)** security check. Windows asks for administrator credentials whenever you try to open elevated system tools—like the **Advanced User Accounts Control Panel** shown in your picture.

To make changes to administrative settings or change the administrator password, Windows requires you to enter the **current password** for the `Admin` account first.

How to Handle This Prompt

- **If you know the current password for the `Admin` account:**
    1. Type the current password into the **Password** field.
    2. Click **Yes** (or press `Enter`).
    3. Once the control panel opens, you will be able to change or manage passwords.
- **If you have forgotten the Administrator password:** Windows intentionally blocks access to this panel without the password to prevent unauthorized changes.

What to Try Next

User prompt: How do I reset my Windows admin password if it's linked to a Microsoft Account?

Response: Because your Windows administrator account is linked to a **Microsoft account**, your computer's administrator password is the same password you use for your Microsoft email (Outlook, Hotmail, Live, etc.).

Here is how you can reset it depending on your current situation:

Method 1: From Another Device (Easiest)

1. Open a web browser on another PC, tablet, or phone.
2. Go to the official Microsoft Account Password Reset page:

   account.live.com/password/reset
3. Enter your Microsoft account email address, phone number, or Skype name.
4. Choose how to receive your identity verification code (via SMS text, email, or an authenticator app).

5. Enter the code and set a new password.
6. **Connect your computer to Wi-Fi/Internet**, then enter your new password on the prompt screen.

Method 2: Directly from the Windows Login Screen

If you are currently locked out at the login screen:

1. Click **I forgot my password** right below the password field on the login screen.
2. Verify your identity using your recovery phone number or backup email.
3. Follow the on-screen instructions to reset your password and gain access.

Method 3: Change Password while Logged In

If you are already logged in to Windows via PIN, fingerprint, or facial recognition:

1. Press `Win + I` to open **Settings**.
2. Go to **Accounts** > **Sign-in options**.
3. Click on **Password**, then click **Change**.
4. Select **I forgot my password** if prompted for your current password, and follow the verification prompts to update it.

User prompt: if i do this my admin password or my palaak account will be passwordless

Response: No, it will **not automatically make your account passwordless** right away.

The message in your screenshot is confirming that **you have successfully added/created a password** for your Microsoft account (`palaksheth9114@gmail.com`).

What the Screen Means

- **What just happened:** Microsoft set a password for your account, which means your account **now has an active password**.
- **What the link offers:** The link (`[account.live.com/proofs/](https://account.live.com/proofs/)...`) is an **optional suggestion** from Microsoft asking if you *want* to go passwordless in the future.

Unless you explicitly click that link and go through the extra steps to turn on **Passwordless Account** (which requires setting up the Microsoft Authenticator app), your account will **keep the password** you just created.

What This Means for Your Admin Password

1. **Your current status:** Your `palaksheth9114@gmail.com` Microsoft account (which acts as your Windows Admin account) now has the password you just set up.
2. **When Windows asks for an Admin Password:** You will enter the password you just created for `palaksheth9114@gmail.com`.
3. **If you decide to go Passwordless later:** Windows will prompt you to approve Admin requests using **Windows Hello (PIN/Fingerprint)** or the **Microsoft Authenticator app** on your phone instead of typing a password.

User prompt: but when i am login to admin it is again showing me not correct password like that

Response: Looking closely at your first screenshot, the User Account Control (UAC) pop-up is specifically asking for the password of a local system account named **`DESKTOP-MQQDQAE\Admin`**, rather than your `palaksheth9114@gmail.com` Microsoft account.

This happens because your current Windows user account is set as a **Standard User**, while the system maintains a separate local account named **Admin**. Changing your Microsoft account password won't affect this local `Admin` account password.

Why the Password Isn't Working

- **Two Different Accounts:** Your Microsoft Account (`palaksheth9114@gmail.com`) and the computer's local **Admin** account (`DESKTOP-MQQDQAE\Admin`) are separate.
- **Standard Privileges:** Because your account isn't set as an Administrator on Windows, Windows demands credentials for the local `Admin` account whenever you try to access system controls.

How to Resolve This

Option 1: Try Common / Previous Local Passwords

If someone else set up this PC, or if you created a local administrator password in the past:

- Try entering any previous local Windows passwords you may have used.
- If a technician, family member, or workplace configured the computer, check with them for the local `Admin` password.

Option 2: Check if Your Account Can Be Promoted to Admin

If you are the only user of this PC and lost local administrator access, you will need to grant administrator rights to your account.

User prompt: now i dont rememeber my admin password and to uninstall app from my palak account they are asking my admin password so how i do that to palak password

Response: To uninstall apps without knowing the local `Admin` password, you have two approaches depending on your account setup:

Option 1: Uninstall Without Admin Rights (Per-User Apps)

Some applications (like Chrome, Spotify, Discord, or web browsers) install per-user and do **not** require administrator permissions to remove.

1. **Open Installed Apps**

   Press `Win + I` on your keyboard to open **Settings**, then go to **Apps** > **Installed apps** (or *Apps & features*).

2. **Find and Uninstall**

   Scroll through the list to find the app you want to remove. Click the **three dots** `...` next to it and select **Uninstall**.

3. **Check for UAC Prompts**

   If the app uninstalls silently without showing the UAC prompt, you are good to go! If the blue/gray `DESKTOP-MQQDQAE\Admin` prompt appears, the app requires administrative rights to remove.

Option 2: Promote Your `palak` Account to Administrator

If the app requires administrative rights, your `palak` account needs to be given Administrator privileges. You can enable Windows' hidden recovery Administrator to grant `palak` full access.

1. **Boot into Windows Recovery**

   Hold down the **Shift** key on your keyboard while clicking **Restart** in the Start Menu. Keep holding Shift until you see a blue screen with options.

2. **Open Command Prompt from Recovery**

   Navigate to **Troubleshoot** > **Advanced options** > **Command Prompt**.

3. **Enable Built-in Administrator**

   In the black Command Prompt window, type the following command exactly as shown and press **Enter**:

   ```
   net user administrator /active:yes
   ```

(If successful, you will see "The command completed successfully.")

4 **Restart and Switch Accounts**

Close Command Prompt and restart your PC. You will now see a new user named **Administrator** on your login screen with no password set. Log into it.

5 **Change palak to an Administrator**

1. Press `Win + R`, type `netplwiz`, and hit **Enter**.
2. Click on your `palak` account and click **Properties**.
3. Go to the **Group Membership** tab, choose **Administrator**, click **Apply**, and hit **OK**.
4. Sign out and sign back into your `palak` account. You can now uninstall any app without entering a separate admin password!

User prompt: How can I reset the local DESKTOP-MQQDQAE Admin password using Windows Recovery?

Response: To reset the local `DESKTOP-MQQDQAE\Admin` account password without knowing the current one, you can use the **Windows Accessibility trick** inside Windows Recovery. This briefly replaces the login screen's Accessibility icon with Command Prompt so you can set a brand-new password.

Step 1: Boot into Windows Recovery Environment (WinRE)

1. Hold down the **Shift key** on your keyboard while clicking **Restart** in the Start Menu.
2. *(Alternative method if locked out completely)*: Turn on your PC, and as soon as the Windows logo/dots appear, hold the physical power button down for 10 seconds to force a shutdown. Do this **twice**. On the third boot, Windows will automatically launch **Preparing Automatic Repair**.
3. Select **Advanced Options** when prompted.

Step 2: Swap the Accessibility Shortcut in Command Prompt

1 **Open Command Prompt from Recovery**

From the blue recovery screen, go to **Troubleshoot** > **Advanced Options** > **Command Prompt**.

2 **Find Your Primary Drive Letter**

In recovery mode, your main drive might be `C:` or `D:`. Type `C:` and hit **Enter**, then type `dir`. If you see the **Windows** folder, `C:` is your main drive. If not, try `D:`.

3 **Navigate to System32**

Type the following command and press **Enter**:

```
cd \Windows\System32
```

4 **Backup Accessibility & Replace with CMD**

Type these two commands one by one, pressing **Enter** after each:

```
ren utilman.exe utilman.bak
```

```
copy cmd.exe utilman.exe
```

(If it asks to overwrite, type `Yes` and hit Enter.)

5 **Reboot Windows Normally**

Type `exit` and hit **Enter**. Click **Continue** to boot back into regular Windows 11/10.

Step 3: Reset the `Admin` Password

1. Once you are back at the login screen, click the **Accessibility icon** (the human/wheelchair icon or stick figure at the bottom-right corner).
2. A Command Prompt window will open with system-level privileges!
3. Type the following command to set a new password for your `Admin` account:

   ```
   net user Admin NewPassword123
   ```

   (Replace `NewPassword123` with whatever new password you want to assign to the local `Admin` account).
4. Press **Enter**. You should see *"The command completed successfully."*

Step 4: Login and Change `palak` to Administrator

1. Close the Command Prompt window.
2. Go back to your `palak` account and try running your app uninstaller again.
3. When the blue/gray UAC prompt pops up asking for `DESKTOP-MQQDQAE\Admin`, type the **new password** you just created (`NewPassword123`).

   📌 **Important Cleanup Step:** Once you are logged in, reopen Command Prompt as Administrator, go back to `C:\Windows\System32`, delete the modified `utilman.exe`,

and rename `utilman.bak` back to `utilman.exe` to restore normal accessibility menu behavior.
